Uniform Distribution

- Exercise 1.9: To get the shorter piece less than $1/5$ of the original, the distance between the location we choose and left/right end of the stick should be lower than $1/5$ of the origin, thus the probability is $2/5$.
- Exercise 1.11: $p = \frac{2^2\pi}{20^2} = \frac{\pi}{100}$
- Exercise 3.4: $X \sim \text{Unif}[4, 10]$, then the p.d.f of X is

$$f(x) = \begin{cases} 1/6 & 4 < x < 10 \\ 0 & \text{Otherwise} \end{cases}$$

- $P(X < 6) = \int_4^6 1/6 dx = 1/3$
- $P(|X - 7| > 1) = P(X < 6) + P(X > 8) = 2/3$
- For $4 < t < 6$, we have

$$P(X < t | X < 6) = \frac{P(X < t)}{P(X < 6)} = \frac{t-4}{6} \cdot 3 = \frac{t-4}{2}$$

- Exercise 3.41: Note that given $Y = k$, $X \sim \text{Unif}(0, k]$ for $k = 1, 2, 3, 4, 5, 6$. Given $s \in (3, 4)$, we have $P(X \leq s | Y = k) = 1$ for $k = 1, 2, 3$ since $X \leq k < s$ in this case. For $k = 4, 5, 6$, $s < k$ implies $P(X \leq s | Y = k) = s/k$. Thus by law of total probability, we have

$$P(X \leq s) = \sum_{k=1}^6 P(X \leq s | Y = k) P(Y = k) = \sum_{k=1}^3 1 \cdot \frac{1}{6} + \sum_{k=4}^6 \frac{s}{k} \cdot \frac{1}{6} = \frac{1}{2} + \frac{s}{6} \left(\frac{1}{4} + \frac{1}{5} + \frac{1}{6} \right) = \frac{1}{2} + \frac{37s}{360}$$

Thus $F(s) = \frac{1}{2} + \frac{37s}{360}$ and $f(s) = 37/360$

Exponential Distribution

- Exercise 4.50: By memoryless property of $T \sim \text{exp}(1/3)$, we have

$$P(\text{Wait for at least addition three hours} | \text{already waited for 7 hours}) = P(T \geq 3) = e^{-1}$$

More generally,

$$P(\text{Wait for at least } x \text{ additional hours} | \text{already waited for 7 hours}) = P(T \geq x) = e^{-x/3}$$

Normal Distribution

- Exercise 3.17: $X \sim N(-2, 7)$ and let Φ be the distribution function of $Z \sim N(0, 1)$

(a)

$$P(X > 3.5) = P\left(\frac{X+2}{\sqrt{7}} > \frac{3.5+2}{\sqrt{7}}\right) = 1 - \Phi\left(\frac{5.5}{\sqrt{7}}\right) = .0188$$

(b)

$$P(-2.1 < X < -1.9) = P\left(\frac{-2.1+2}{\sqrt{7}} < \frac{X+2}{\sqrt{7}} < \frac{-1.9+2}{\sqrt{7}}\right) = \Phi\left(\frac{-.1}{\sqrt{7}}\right) - \Phi\left(\frac{.1}{\sqrt{7}}\right) = .032$$

Note that $\Phi(-z) = 1 - \Phi(z)$ and $\Phi(z) - \Phi(-z) = \Phi(z) - (1 - \Phi(z)) = 2\Phi(z) - 1$.

(c)

$$P(X < 2) = P\left(\frac{X+2}{\sqrt{7}} < \frac{2+2}{\sqrt{7}}\right) = \Phi\left(\frac{4}{\sqrt{7}}\right) = .9345$$

(d)

$$P(X < -10) = P\left(\frac{X+2}{\sqrt{7}} < \frac{-10+2}{\sqrt{7}}\right) = \Phi\left(\frac{-8}{\sqrt{7}}\right) = 1 - \Phi\left(\frac{8}{\sqrt{7}}\right) = .0013$$

(e)

$$P(X > 4) = P\left(\frac{X+2}{\sqrt{7}} > \frac{4+2}{\sqrt{7}}\right) = 1 - \Phi\left(\frac{6}{\sqrt{7}}\right) = .0116$$
